

**Configure Kitchen/Drinks Printer to
Print a Separate Docket for each Item -
HOW TO**

Some sites wish to have their drink docket print a separate docket for each item that is sold, rather than the norm of printing the entire order on one docket.

Follow these instructions to achieve this setup

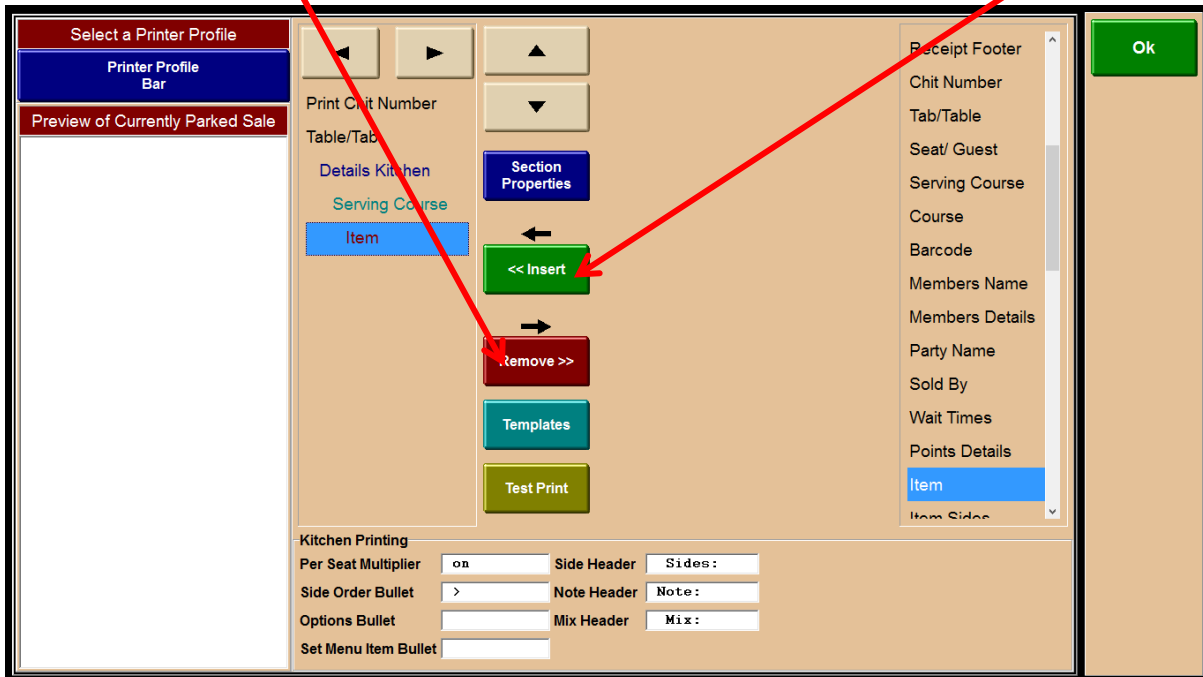

Step 1: Using the SETUP KITCHEN DOCKET from Maintenance, Printer Maintenance select the printer that you need to configure. Then insert the default template as the starting point.

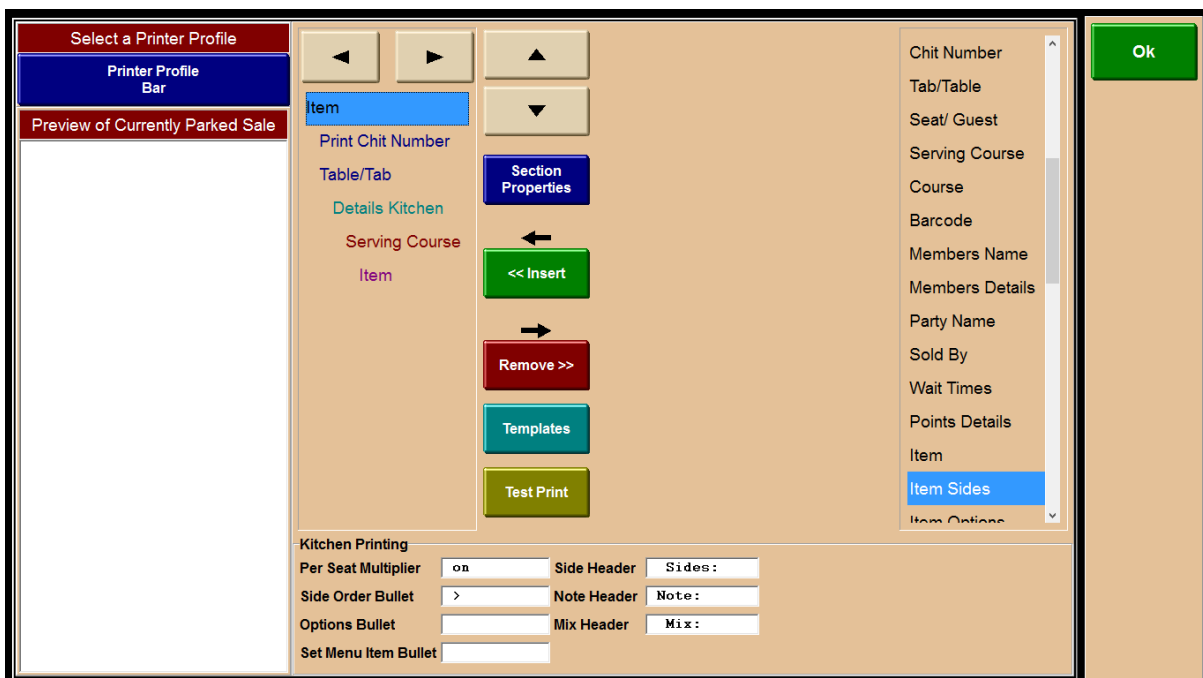

Step 2: Highlight DETAILS KITCHEN and select Section Properties. Then select Cut at End of Block to change it to BLUE.

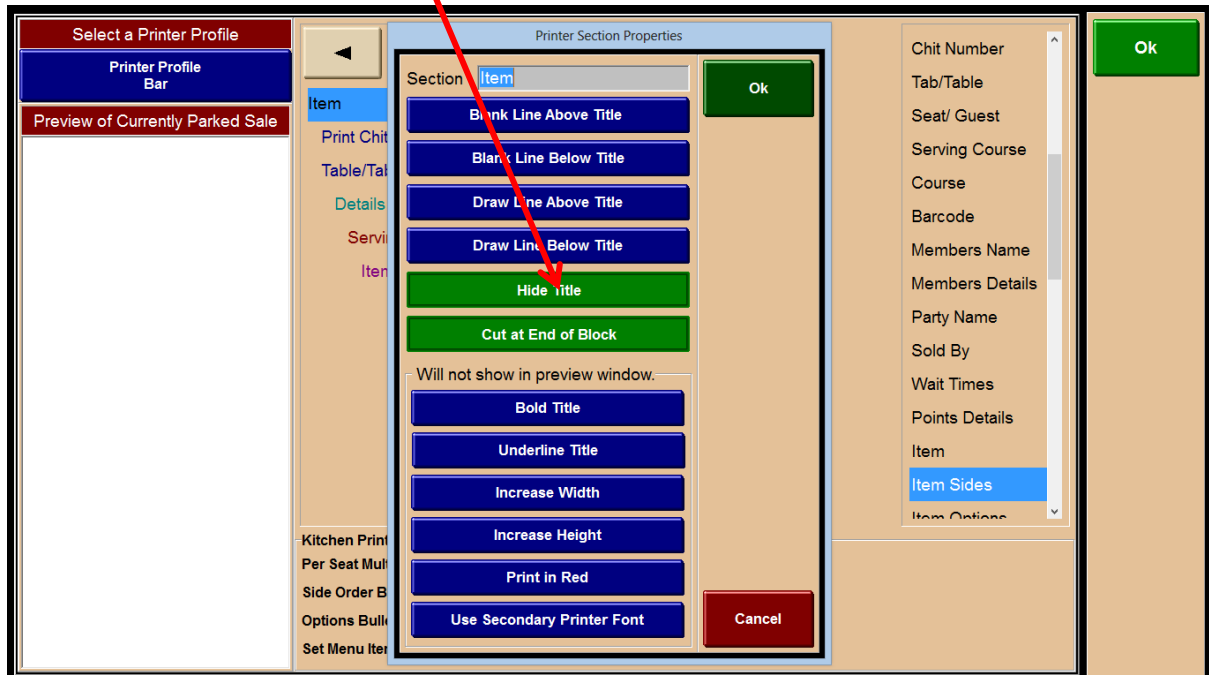

Step 3: Use the Remove function to remove the element called Items. Then use the Insert function to insert the element call Item.

Step 4: Use the Insert function to insert the element Item at the top of the docket format. Use the UP and DOWN arrows to move it to the top. Then use the Left and Right arrows to move all of the other element one step inwards.

Step 5: Highlight the Item element at the top of the docket configuration and select Section Properties. Then select Hide Title and Cut at End of Block so that they turn green.

These five steps will achieve the result the site is looking for.
